# USE CASE CONTENT

1.ARCHITECTURE:

In architecture we have followed the MVC architecture.

MODEL: In model there are classes like UserSavedInDb and BankDb of platform

VIEW: In Views there are screens like Register , Login , Main Screen etc

Controllers: In Controllers there are controllers and classes like Savedata , VerifyAmount , CheckAuthentication which interacts with models and views and do storing in db.

2.Business Model:

We have seen that in past many big projects and products fail due to bad business models so we have selected a business model that hopefully will not fail.

In it we will sell your application and script on MetaTrader market where freelancers can sell their applications and bot, then we will use Digital Marketing to sell our product.

Also launch this application as platform if everything goes well.

3.Risk Reduce:

We will reduce the risk by doing research on the market, trading and the script to check the market.

It is for sure a risk free application because it depends on research work and if every thing goes on and the application started producing profit by trades at least we will be able to make money from it, if the application was not sold according to our expectations we can make money out of it just by personal use.
